Dear Jakob Blaavand,

I am writing to apply for the Data Scientist role with BESTSELLER. My background is in full-cycle product development, data science, and machine learning, with recent work centered on building AI-powered commercial platforms and developing predictive analytics systems.

Amongst others, I have built a salon marketplace and a booking/management app from the ground up, with AI functionalities that support core business processes. These projects show my ability to create, validate, and scale data-driven solutions in real-world environments.

Currently, I am expanding my proficiency with Databricks and cloud analytics through focused online study. My experience includes machine learning, predictive modelling, time series analysis, and advanced data analytics. I am strong in Python and comfortable working with diverse datasets and deploying models for production use.

I communicate clearly in English and deliver technical insights to both engineering and business teams. My work on user-facing apps has sharpened my attention to detail and sense of design.

Some of my work is available on GitHub at github.com/philipposk and on my personal site at 6x7.gr.

I am eager to contribute to BESTSELLER's mission of delivering innovative data science to the fashion supply chain and to grow alongside your team as I expand my technical expertise. Thank you for considering my application.

Kind regards, Filippos
